## **Overview:**

Our project is a university network that connects the Computers in labs together using switches, router, and servers. The network topology was implemented on Cisco packet tracer to visualize how each device is connected to the others. The network connects four faculties and ensures the connectivity between devices and sub-networks. In addition, we implemented classless addressing to distribute by IP using Dynamic Host Configuration Protocol.

# TOPOLOGY

We used Cisco Packet Tracer to implement the entire university network. We are four members in the team so, each one of us worked on creating one faculty devices. In each faculty(multiswitch), there are four floors(multiswitches). On each floor(multiswitch), there are five labs(switches). Each lab(switch) includes ten PCs. To clearly specify the number of PCs in each lab. We grouped each ten PCs in a colored rectangle.

# Router Connections

The university has one router that connects the four faculties (multiswitches) together. We applied a star topology connection as we believe this is the best topology type to implement in a university campus with eight hundred PCs. Star topology has many advantages. First, it is safe. The failure of one device connection will not lead to the damage of the entire network because each device has its own connection. Second, it is secure. The devices are connected individually therefore, it is difficult for unauthorized users to access the network. Third, it is flexible. It can accommodate a variety of cable types according to the network needs and budget.

# DHCP

To implement the Dynamic Host Configuration Protocol (DHCP), we started by writing the network, ip address, default router, and dns server for each faculty in the router command. This resulted in creating an IP for each PC by DHCP. Then, We changed each PC from Static IP Configuration to dynamic IP configuration. Finally, the IP addresses were created dynamically for each PC.

```
ip dhcp excluded-address 192.168.1.1 192.168.1.10
ip dhcp excluded-address 192.168.2.1 192.168.2.10
ip dhcp excluded-address 192.168.3.1 192.168.3.10
ip dhcp excluded-address 192.168.4.1 192.168.4.10
!
ip dhcp pool LAN1
 network 192.168.1.0 255.255.255.0
 default-router 192.168.1.1
 dns-server 8.8.8.8
ip dhcp pool LAN2
 network 192.168.2.0 255.255.255.0
 default-router 192.168.2.1
 dns-server 8.8.8.8
ip dhcp pool LAN3
 network 192.168.3.0 255.255.255.0
 default-router 192.168.3.1
 dns-server 8.8.8.8
ip dhcp pool LAN4
 network 192.168.4.0 255.255.255.0
 default-router 192.168.4.1
 dns-server 8.8.8.8
```

The screenshot shows the 'IP Configuration' window for the 'FastEthernet0' interface. The 'IP Configuration' tab is active, and the 'DHCP' radio button is selected. The 'Static' radio button is also visible. The 'DHCP request successful.' message is displayed. The configuration fields are as follows:

| Field           | Value         |
|-----------------|---------------|
| IPv4 Address    | 192.168.1.14  |
| Subnet Mask     | 255.255.255.0 |
| Default Gateway | 192.168.1.1   |
| DNS Server      | 8.8.8.8       |

Below the IPv4 configuration, the 'IPv6 Configuration' section is visible. The 'Automatic' radio button is selected, and the 'Static' radio button is also visible. The configuration fields are as follows:

| Field              | Value                    |
|--------------------|--------------------------|
| IPv6 Address       |                          |
| Link Local Address | FE80::206:2AFF:FE79:99D3 |
| Default Gateway    |                          |
| DNS Server         |                          |

At the bottom, the '802.1X' section is visible. The 'Use 802.1X Security' checkbox is unchecked. The 'Authentication' dropdown menu is set to 'MD5'. The 'Username' and 'Password' fields are empty.

# VLAN

The Virtual Local Area Network is applied on a faculty (multiswitch). Generally, VLAN is used to connect multiple devices and network nodes from different LANs into one logical network. Moreover, it improves security and traffic management in the network.

# RIP

Routing Information Protocol (RIP) is generally used to manage the routing in the university network. It is implemented by configuring the main router and switches to use RIP for routing data between faculties and the Scientific Computation Center.

```
Router>enable
Router#config t
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#interface GigabitEthernet0/1
Router(config-if)#ip address 192.168.2.1 255.255.255.0
Router(config-if)#no shutdown

Router(config-if)#
%LINK-5-CHANGED: Interface GigabitEthernet0/1, changed state to up
%LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/1, changed state to up
Router(config-if)#exit
Router(config)#exit
Router#
%SYS-5-CONFIG_I: Configured from console by console

Router#enable
Router#config t
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#router rip
Router(config-router)#version 2
Router(config-router)#network 192.168.0.0
Router(config-router)#network 192.168.1.0
Router(config-router)#network 192.168.2.0
Router(config-router)#copy running-config startup-config

% Invalid input detected at '' marker.
Router(config-router)#exit
Router(config)#exit
Router#
%SYS-5-CONFIG_I: Configured from console by console

Router#copy running-config startup-config
Destination filename [startup-config]?
